

Amendments to the Specification

Please amend the paragraph on page 3 at lines 25-33 as follows:

Now reference is made to figure 2 where an end view of a loop 10 is shown. The loop 10 is made of a support material 12 and it is provided with longitudinal low friction strips 11 on the inside. Friction material [[1]] in the form of strips 13 with considerable thickness is arranged outside the support material 12 in the area outside the low friction strips 11. The difference compared to the embodiment shown in figure 1 is that there is also a thin layer 14 of friction material on the outside of the support material 12 in the area between the low friction strips 11. However, the thickness of the friction material 14 in the area between the low friction strips 11 is significantly less than that in the area above the low friction strips 11.
